

For your reference, I include the band structure in two cases. The red curves only use γ_1 , while the blue curves use all four springs. You can see that the blue curves are reasonably close to the published results.

- (a) Numerically compute the DOS for the red curves (i.e. using only γ_1).
- (b) Numerically compute the DOS for the blue curves (i.e. using $\gamma_1, \gamma_2, \gamma_3, \gamma_4$).
